

# Gavi Market Shaping Externalities

---

March 2018

Reach every child  
[www.gavi.org](http://www.gavi.org)

# What is the context of this project?

- Gavi has helped enable **remarkable progress in immunization** over the last 17 years, including fostering significant improvements in market dynamics
- While Gavi has been highly effective in achieving its core objectives, discussions have been ongoing for some time about the extent to which Gavi's **market shaping work may create both positive and negative externalities** (or unintended consequences) for stakeholders in the vaccine landscape. This includes effects on countries (both Gavi-supported and other middle-income countries), manufacturers, and other partners
- Externalities can have important consequences. It is therefore **important to fully understand what externalities exist, their relative importance**, and how they can be measured
- Through this effort, we have identified key potential externalities and developed a **framework to monitor them**, including indicators to measure them. At this stage, we will not focus on mitigation actions but only on tracking these unintended consequences

# Why does this framework matter?

- **Create a common understanding of:**
  - What are the potential and realized unintended consequences of Gavi market shaping
  - Which externalities are priorities to monitor
  - What are the drivers behind these externalities
  - How may the agreed-upon framework look
- Understand the “long-list” of potential positive and negative **externalities from the point of view of different stakeholders and what matters to them**
- **Measure the size of the impact and trends over time to gain insights and potentially adjust (e.g., reprioritize)**
- **Provide a fact base for decision making**, e.g., future market shaping strategy and actions, how to balance the three different market shaping objectives of balanced supply and demand, affordability, and innovation

# What is an externality?

## What it is...

- **An unintended consequence (positive or negative) of Gavi's market-shaping activities** for vaccines or other immunization related products, that:
  - may affect Gavi-supported countries, non-Gavi-supported countries, manufacturers, or other partners
  - may impact products or services that are part of Gavi's portfolio or others e.g., health systems, vaccines or immunization-related products outside Gavi's priorities
- This unintended consequence may **have already materialized or may be considered a future risk** to monitor

## What it's not...

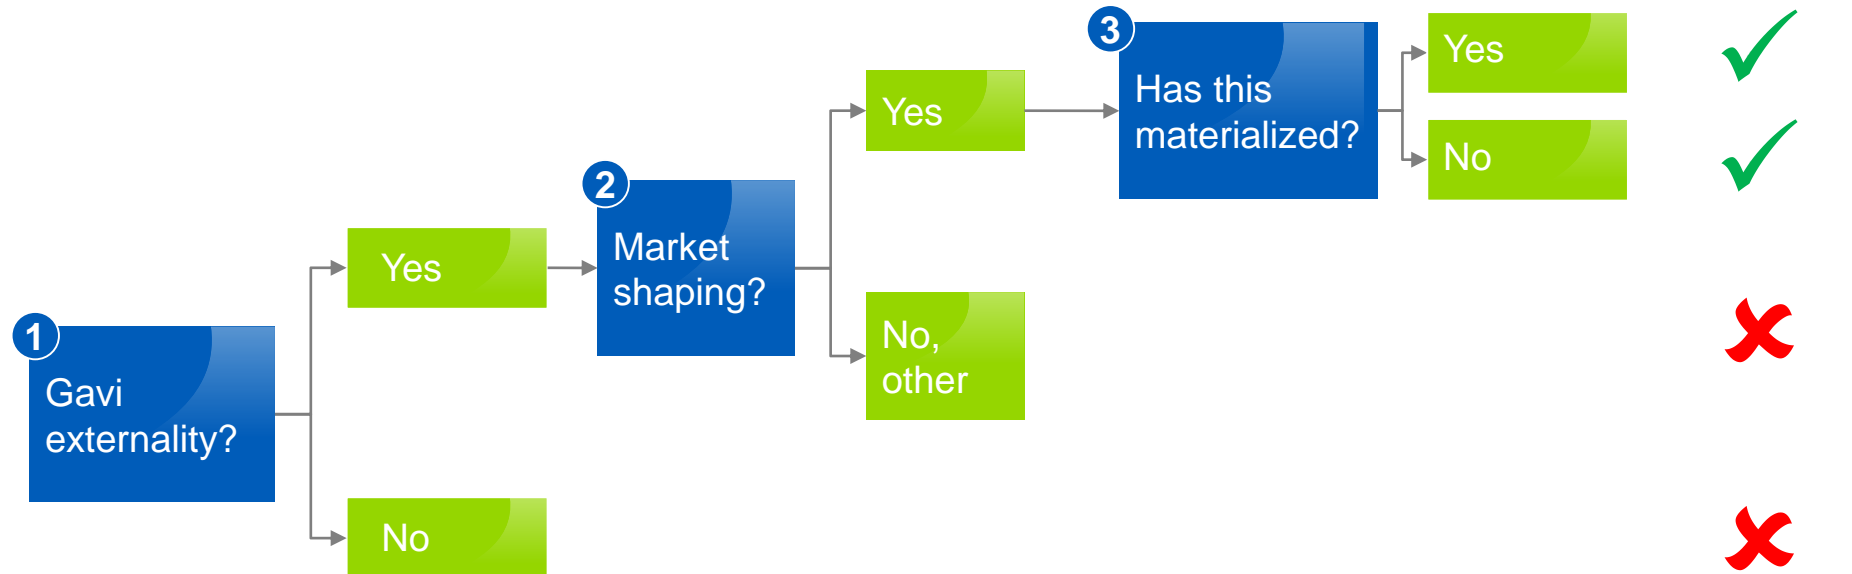

- **An intended consequence of Gavi's (market-shaping) activities**, which is part of Gavi's mission (e.g. reduced prices to a sustainable level for Gavi-funded vaccines and products)
- A negative consequence of **market dynamics, political or economic context** that is not meaningfully influenced by Gavi's market shaping activities
- **Something that Gavi has tried to do but not fully succeeded** in doing (e.g. perception that Gavi should negotiate lower prices for a particular antigen)

## Note on "core" externalities

- Certain externalities relate to the **"core" of Gavi's market shaping work**, i.e., relate to Gavi-funded products in Gavi-supported countries
- A negative trend in one of these could indicate that **one market shaping objective had outweighed another** (e.g. over-emphasis on affordability could result in a negative externality relating to supply security)
- **A positive trend would not indicate an externality**, but could indicate success towards Gavi's goals

# The monitoring framework will consider observed and potential externalities of Gavi's market shaping activities

## Decision tree

## Questions to consider

- 1** *Is this a potential unintended consequence of Gavi's activities?<sup>1</sup>  
If this were to occur, would Gavi be a primary driver?*
- 2** *Is this externality specifically due to market shaping, or to other Gavi activities (e.g. VIS, policies, existence of Gavi funding)?*
- 3** *Is there evidence that the consequence has already occurred? Is it something that is a future risk but has not yet materialized?*

<sup>1</sup> If a "core" externality, the presence of an externality could indicate that one objective (e.g., affordability) had been prioritized at the expense of another objective (e.g., supply security)

# We developed and refined the framework for monitoring externalities through a collaborative process

## Gavi's public consultation

- Collected wide range of views on potential externalities & indicators through 10 individual submissions representing a broad constituency
- Developed long-list of externalities based on public consultation and insights from other experts

## Stakeholder interviews

- Assessed completeness, validity and degree of alignment around identified externalities through 28 stakeholder interviews
- Identified additional externalities and specific case examples

## Stakeholder workshop

- Reviewed proposed long-list of externalities and classification with 8 workshop participants
- Identified final amendments and disagreements
- Prioritized externalities to monitor
- Began to identify indicators

## Finalize framework

- Finalized prioritization of externalities into framework based on feedback
- Conducted additional interviews as needed to refine framework

## Develop indicators and guidelines

- Defined which indicators will be used to monitor the externalities
- Consulted with additional stakeholders to refine the indicators
- Developed guidelines for how to interpret the indicators

### CONSOLIDATED COMMENTS FROM THE PUBLIC CONSULTATION ON EXTERNALITIES OF GAVI MARKET SHAPING ACTIVITIES

**INTRODUCTION**  
In June 2017, Gavi, the Vaccine Alliance launched a public consultation process on externalities of market shaping. The consultation was open from 26 June 2017 to 02 August 2017. This document provides an overview of the process, as well as a summary of the main themes that emerged from the comments received. It does not necessarily reflect the views of Gavi, the Vaccine Alliance.

### DESCRIPTION OF THE CONSULTATION

Letters invited from the first 10 years of Gavi's existence suggested that market forces alone would not sufficiently respond to the health needs of low-income countries. Drawing from these lessons, Gavi defined a more explicit and proactive approach to shaping vaccine markets with the development of a [Supply and Demand Assessment \(SDA\)](#), which sets out the strategic framework to address our priorities.

While primarily intended to benefit the countries that Gavi supports, the ultimate goal of Gavi's market shaping work is to improve the health of markets as a whole - for manufacturers, countries and patients. But in doing so, our market shaping activities may have unintended consequences. Such consequences, or externalities, can be both positive and negative, direct and long-term.

[https://www.gavi.org/what-we-do/our-work/externalities-of-market-shaping-activities](#)

### Example poster

**Reasons for "yes"**

- Cost-effective: Shaping vaccine markets can be a cost-effective way to increase vaccine coverage and reduce the burden of disease.
- Improved access: Shaping vaccine markets can improve access to vaccines for underserved populations.
- Increased innovation: Shaping vaccine markets can encourage innovation in vaccine development.

**Reasons for "no"**

- Market distortion: Shaping vaccine markets can distort the market and lead to higher prices for other vaccines.
- Reduced competition: Shaping vaccine markets can reduce competition and lead to higher prices for vaccines.
- Unintended consequences: Shaping vaccine markets can have unintended consequences, such as reduced innovation or reduced quality of vaccines.

**Quotes and examples**

"This is definitely an externality. By focusing solely on getting down price (GDP) in primary and secondary care other than..."

"If we are to be successful in getting down price (GDP) in primary and secondary care other than..."

"I am not sure that we should be focusing on..."

"There is a definite gap between product without..."

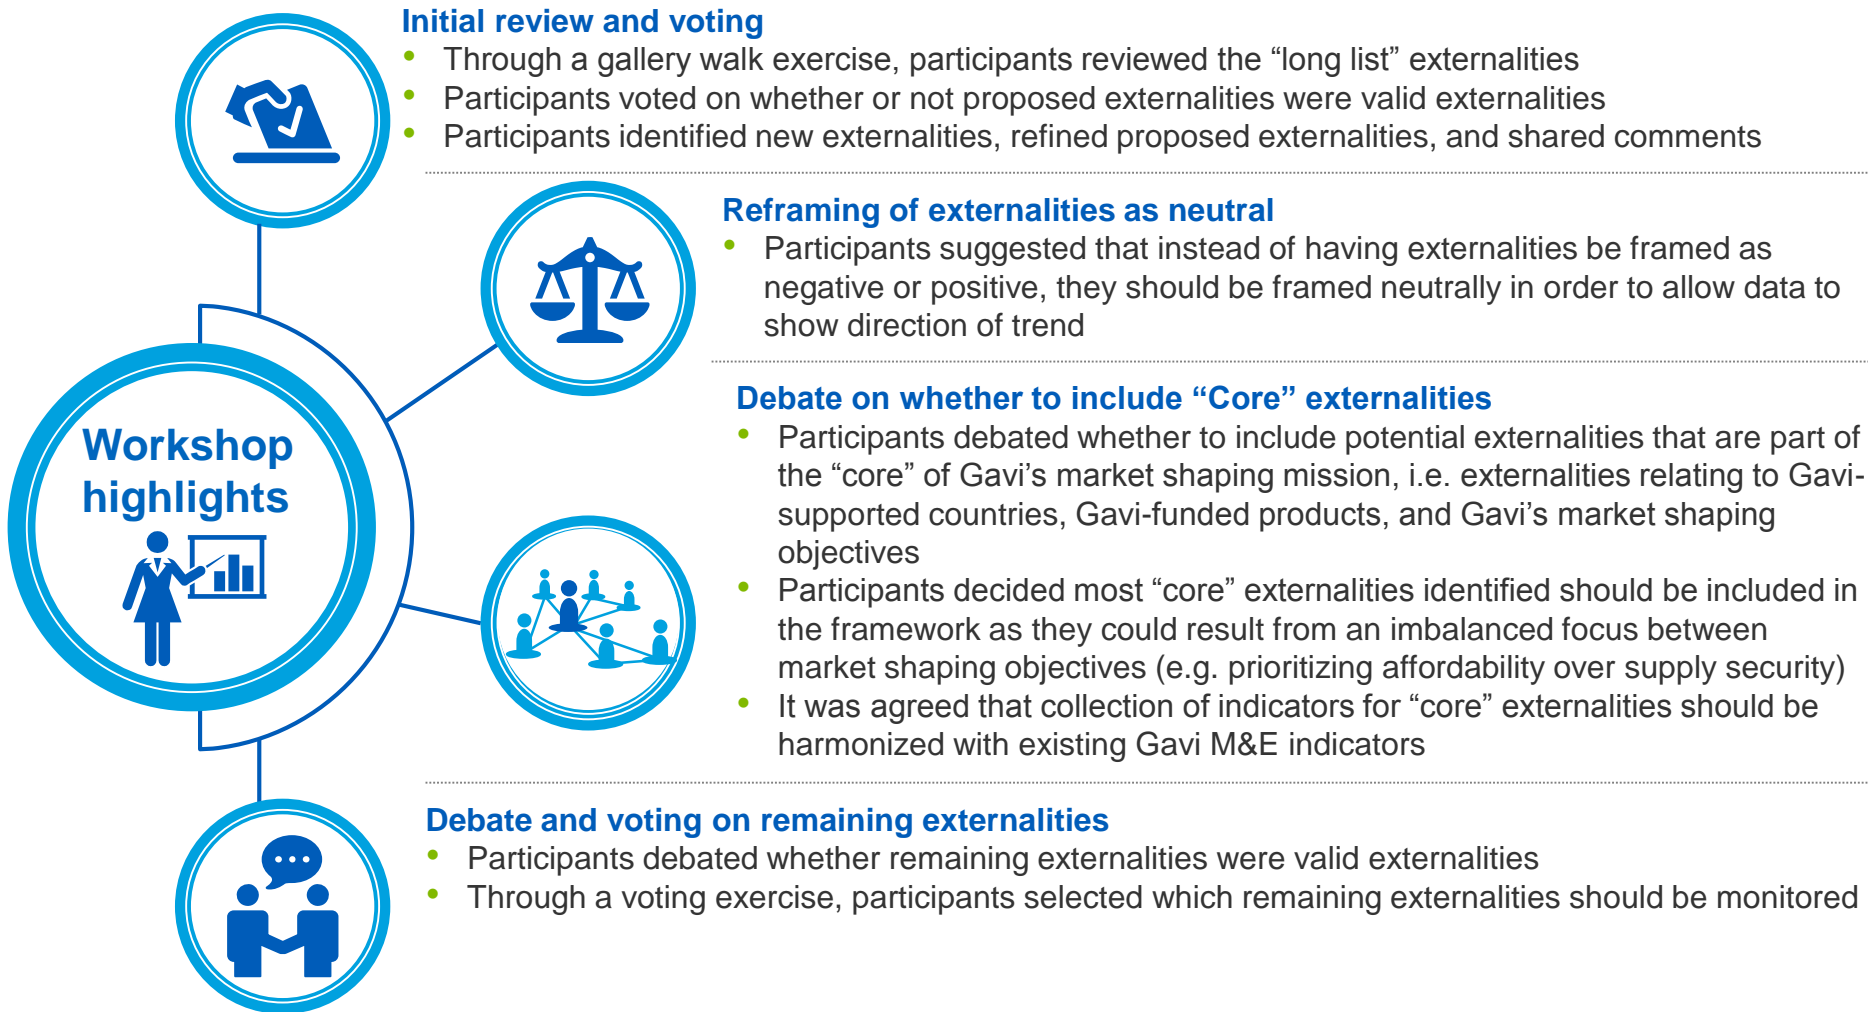

# We interviewed 28 stakeholders among the below organisations through this process

## Organization/ Country

<b>Manufacturers</b> 		Sanofi Pasteur		Serum Institute of India
		GSK		Vaccine Business Unit, LG Chemicals
		Merck		Biological E
		Pfizer		Walvax Biotechnology Co
<b>Partners and country representatives</b> 		IVI		PAHO
		JSI		Independent (ex CDC)
		PATH		Independent (ex WHO)
		CHAI		Independent (ex Gavi)
<b>Countries/ Country viewpoints</b>		Equatorial Guinea		Gabon / WHO AFRO
		Capo Verde		Rwanda
		Angola		Thailand
		DRC		Sri Lanka
		Gavi		
<b>Academia</b> 		Rochester Institute of Technology		

# Through a workshop conducted in November 2017, a diverse set of stakeholders<sup>1</sup> shared views on the initial “long list” of externalities

<sup>1</sup> Workshop participants included: Marion Menozzi-Arnaud (Gavi), Melissa Malhame (Gavi Alumna), Andrea Ware (William Davidson Institute at the University of Michigan), Philipp Kalpaxis (UNICEF SD), Robyn Iqbal (BMGF), Tania Cernuschi (WHO), Corinne Bardone (IFPMA / Sanofi), James Droop (DFID)

# The externalities monitoring framework is divided into three categories

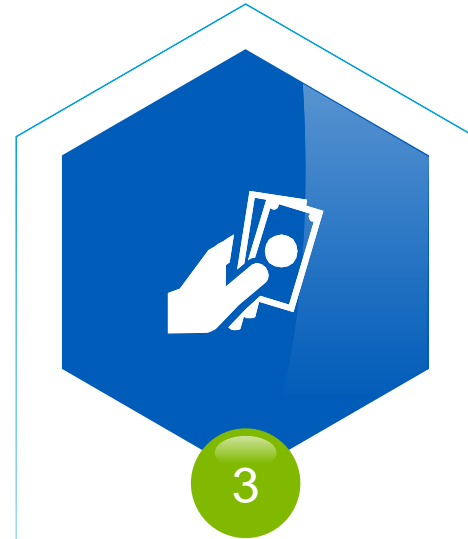

---

Investments in  
research and  
development

Supply security for  
countries and  
sustainability for  
manufacturers

Affordability for  
countries

# Framework overview

## Category

## Externality: Gavi's market shaping activities may result in unintended changes in ...

### 1 Investments in research and development

- A Investment in vaccine development for antigens where disease burden is predominantly in Gavi-supported countries and middle-income countries
- B Investment in improvements to existing vaccines in Gavi portfolio, e.g. investments in thermo-stability
- C Investment in development of new cold chain equipment

### 2 Supply security for countries and sustainability for manufacturers

- A Manufacturer diversity for Gavi-funded products<sup>1</sup>, including overall number and geography
- B Global capacity to produce and availability of Gavi-funded products
- C Global capacity to produce and availability of non-Gavi-funded products targeted at low- and middle-income countries
- D Range of presentations of existing products available to Gavi-supported countries

### 3 Affordability for countries

- A Price trends and price volatility for Gavi-funded products in non-Gavi-supported countries

<sup>1</sup> All references to products in the framework refer to vaccines and CCE

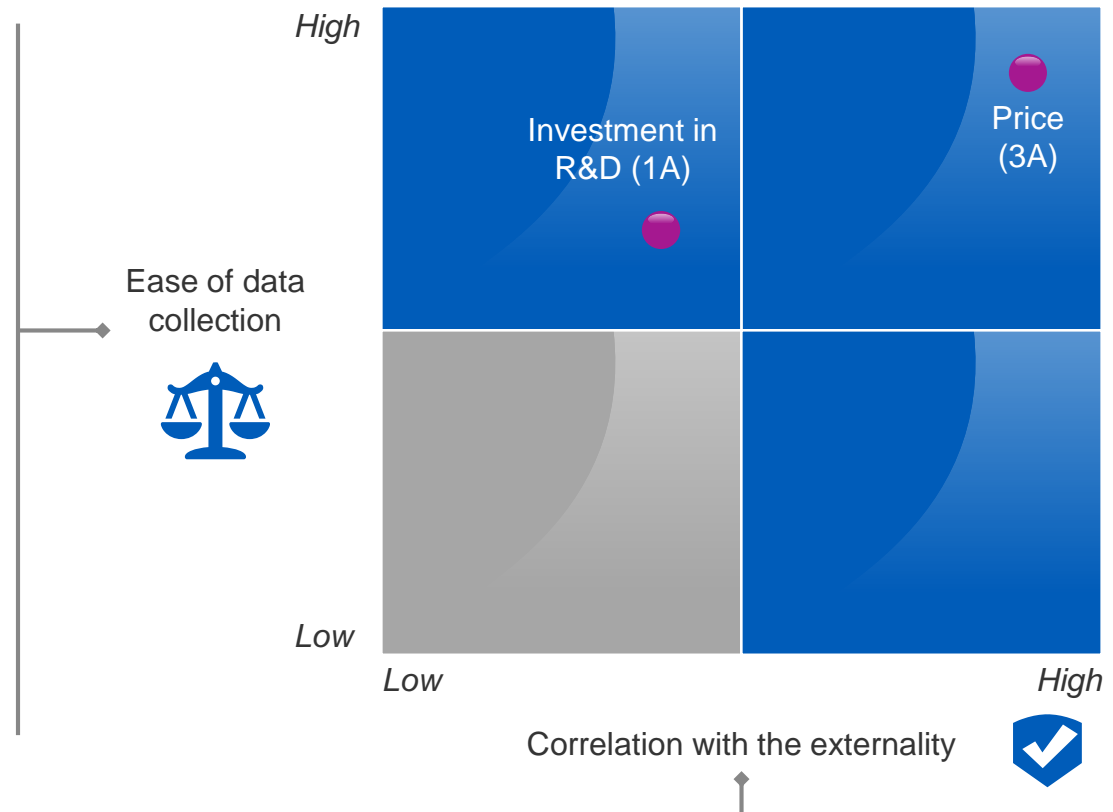

# We selected indicators for each externality based on their correlation with the externality and the ease of data collection

■ Excluded from consideration ■ May be considered as indicators

## Initially prioritized indicators use secondary data sources, thereby improving ease of data collection

- Indicators could ultimately use **secondary data, proxy data<sup>1</sup>, or primary data**; initially prioritized indicators use secondary data that is relatively easy-to-access
- It was decided that **no new data collection** will be conducted during the initial period. Over time, it may be decided that **primary or proxy data collection** is needed
- In the case of “core”<sup>2</sup> externalities, **data collection will be harmonized with existing Gavi data collection**

## Indicators can be assessed along two axes ...

## The level of correlation between the externalities and indicators will vary

- Some externalities have perfectly-correlated indicators
- For others, it is necessary to look at more than one indicator and to carefully **interpret imperfect indicators**

<sup>1</sup> Calculated data using existing data sources and expert-driven assumptions  
<sup>2</sup> “Core” externalities refer to Gavi-funded products in Gavi-supported countries

# Draft overview of prioritized indicators

## – to be further amended based on data analyses and insights

Category	Externality	Indicator(s) <sup>1</sup>	Control or counterfactual indicator	
<b>1</b> Investments in research and development 	<b>A</b> Investment in vaccine development for antigens where disease burden is predominantly in Gavi-supported countries and middle-income countries	<b>i</b> Total vaccine R&D spend and manufacturers' self-reported R&D spend  <b>ii</b> Number of newly launched vaccine development efforts <b>iii</b> Number of vaccines in development <b>iv</b> Pace of progression of vaccine development pipeline	<ul style="list-style-type: none"> <li>Total non-vaccine R&amp;D spend and manufacturers' self-reported R&amp;D spend for diseases predominantly in low-income countries (G Finder)</li> </ul>	
	<b>B</b> Investment in improvements to existing vaccines in Gavi portfolio, e.g. investments in thermo-stability	<b>i</b> Number of products with improved characteristics procured	<ul style="list-style-type: none"> <li>Number of improvements launched to non-Gavi vaccines (UNICEF)</li> </ul>	
	<b>C</b> Investment in development of new cold chain equipment	<b>i</b> Number of CCE products available on the market that are in the scope of the CCEOP	<ul style="list-style-type: none"> <li>TBD</li> </ul>	
	<b>2</b> Supply security for countries and sustainability for manufacturers 	<b>A</b> Manufacturer diversity for Gavi-funded products, including overall number and geography	<b>i</b> Number and geographic location of manufacturers for each antigen	<ul style="list-style-type: none"> <li>Manufacturer diversity for non-Gavi-funded vaccines (UNICEF)</li> </ul>
		<b>B</b> Global capacity to produce and availability of Gavi-funded products	<b>i</b> Number of vaccine markets with sufficient and uninterrupted supply <b>ii</b> Global percent of countries reporting shortages at national level	<ul style="list-style-type: none"> <li>Global capacity to produce and availability of non-Gavi funded products targeted at low- and middle-income countries (2C)</li> </ul>
		<b>C</b> Global capacity to produce and availability of non-Gavi-funded products targeted at low- and middle-income countries	<b>i</b> Estimates of supply / demand balance <b>ii</b> Global percent of countries reporting shortages at national level	<ul style="list-style-type: none"> <li>Global capacity to produce and availability of non-Gavi funded products targeted at low- and middle-income countries (2B)</li> </ul>
<b>D</b> Range of presentations of existing products available to Gavi-supported countries		<b>i</b> Number of distinct product presentations offered for Gavi-supported antigens	<ul style="list-style-type: none"> <li>Number of distinct product presentations offered for non-Gavi-supported antigens (UNICEF data)</li> </ul>	
<b>3</b> Affordability for countries 	<b>A</b> Price trends and price volatility for Gavi-funded products in non-Gavi-supported countries	<b>i</b> Price trends for Gavi-funded products; calculated price volatility of Gavi-funded products	<ul style="list-style-type: none"> <li>Price trends and price volatility for non-Gavi-funded vaccines in non-Gavi-supported countries (GVMM data)</li> </ul>	

<sup>1</sup> For some externalities, indicators relating to CCE will not be collected during the initial phase of monitoring, but may be added in the future

# We can understand trends in the externalities and interpret indicators using a four step process

Through four steps, we can assess trends and conduct qualitative analysis...

- 1 Analyze indicator trends
- 2 Analyze control or counter-factual trends
- 3 Conduct additional qualitative and quantitative analysis as needed to understand causality
- 4 Make overall assessment of whether changes seen were caused by Gavi market shaping

- Questions to determine whether there is a causal link\***
- 1) Analyze drivers
    - Were changes due more to declines in private sector spend or other R&D spend?
    - When were declines greatest?
  - 2) Analyze potential non-Gavi drivers:
    - Were there any important non-Gavi-related drivers, e.g., changes in strategy by major spenders?
    - How did the impact of non-Gavi drivers compare with the impact of the Gavi market shaping-related drivers?
  - 3) Understand stakeholder perceptions
    - How do stakeholders and experts perceive the influence of Gavi market shaping on this trend?
    - Does this perception appear to be based on an accurate understanding of the facts?
  - 4) Evaluate overall evidence base to determine assessment

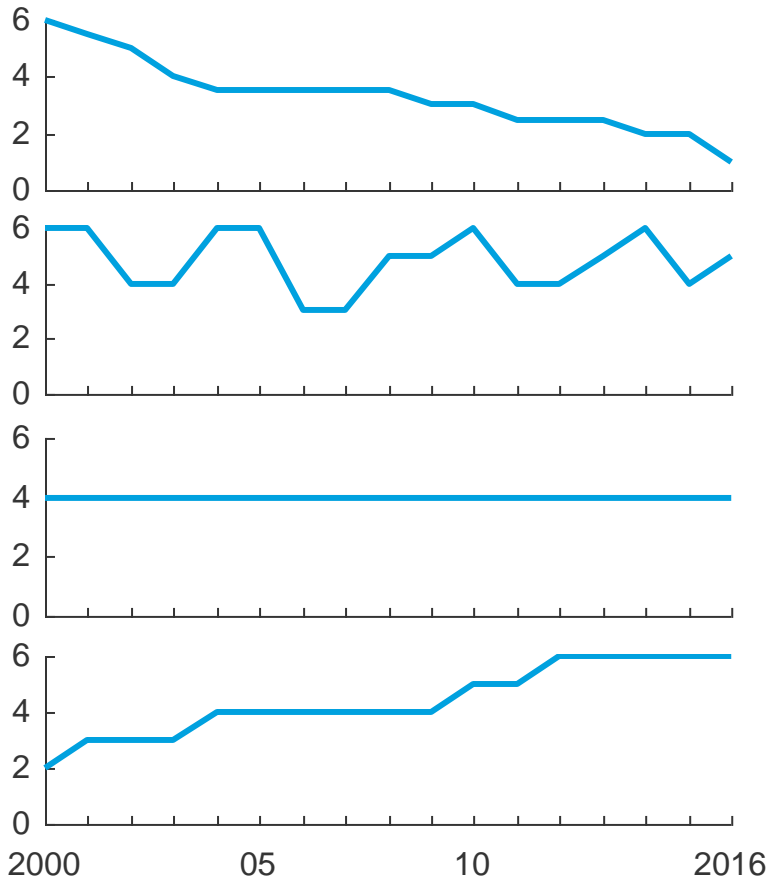

... which can be used to assess externalities through a decision tree approach

# 1 Through an initial analysis of indicators, we can determine whether trends are consistent with a potential externality

Illustrative example: Price trends and price volatility for Gavi-funded products in non-Gavi-supported countries

If prices for most Gavi-funded vaccines in non-Gavi supported countries are...

Declining

This would indicate...

No evidence of negative externality; may indicate positive externality

Variable, flat or mixed results for different vaccines

Uncertain; assess counterfactual and investigate further to understand trend and causality

Increasing

May indicate a negative externality; investigate further to assess causality

## 2 Where available, we can compare control or counter-factual data with the trends observed in the indicators

To assess whether there is a causal link between Gavi market shaping and a trend in indicators that would suggest such a link, we can consider...

### Time series (forward-looking)

- What trends do we observe in the data over time (beginning now)?
- How (if at all) do trends in the indicator change when aspects of the market shaping strategy change?

### Historical perspective / counterfactual

- What were trends in the indicator before and after Gavi market shaping-related “inflection points”?
  - Gavi launch
  - Gavi market shaping launch
- From the changes in trends, can we assess what may have happened in the absence of Gavi market shaping?

### Control or counter-factual data

- What are the trends in a comparable data set that was not influenced by Gavi market shaping?
- How do the trends differ from trends in the indicator?

- We will look at **retrospective and prospective changes in all indicator trends**, but historical data is not available for many, e.g., some goes back only to 2007
- Where a **useful control data set** is available, we will also consider this data

# We can assess whether there are any changes in trend in the indicators near certain Gavi-related “inflection points”

## Basic outline of inflection points

## Additional details needed

- A basic timeline of key inflection points will need to be **overlaid with additional details**, including but not limited to:
  - Vaccine-specific tender calendars (as applicable)
  - Major market shaping decisions taken that relate to specific products
- To define the key inflection points, it will be important to **consult with additional stakeholders** both within and outside of Gavi

## 2 Analysis of trends can help to determine whether an externality may be present...

Trend before inflection point is similar to trend after inflection point

May indicate there is a **non-Gavi secular trend**

Trend after inflection point is markedly different from before

May indicate trend is driven by **Gavi-related factors**; investigate further

Trends in control are similar to trends in indicator

May indicate there is a **non-Gavi secular trend that affects both the indicator and the counterfactual**, e.g., increasing production costs

Trends in control differ from trends in indicator

May indicate trend is driven by **Gavi-related factors**; investigate further

3

4

## ...but additional analysis is required to assess causality

### Illustrative example: Upward price trends and increasing price volatility for Gavi-funded products in non-Gavi-supported countries

#### 3A Analyze potential market shaping-related upward price drivers

- Manufacturers may charge higher prices to non-Gavi-supported countries to compensate for lower returns in Gavi-supported countries
- Gavi market shaping for LICs may limit the negotiation impact of MICs
- Downward price pressure may cause manufacturers to leave the market or not enter, thus reducing competition and increasing the risk of future price increases

Is there evidence to suggest these Gavi market shaping drivers are influencing the trend?

#### 3B Analyze potential non-Gavi drivers

- API or other input costs may have increased
- Production costs may have increased
- Manufacturers' pricing strategy may have changed
- Competition may have decreased for non-Gavi-related reasons, leading manufacturers to increase prices

How did the impact of non-Gavi drivers compare with the impact of the Gavi market shaping-related drivers?

#### 3C Understand stakeholder/expert perceptions

- How do stakeholders and experts perceive the influence of Gavi market shaping on this trend?
- Does this perception appear to be based on an accurate understanding of the facts?

How do stakeholders and experts weigh the relative importance of different drivers?

4

### What is the overall assessment?
